Psychology as Standards of Mental Behavior

Monday, August 3, 2020

A mind is one of the life support systems of the body. As such it has a well defined biologically determined job to perform and a well defined physically determined method of doing that job. My address is then inclusive of the intelligible and the perceptible.

The mind is the most powerful life support system possible; as such it takes longer to evolve and longer to mature than any other life support system of the body. The mind of man is still not, by definition, functional. During its evolution, a mind is not aware of what correct functional behavior means; in short, one can define schizophrenia as a particular mind falling short of the biologically defined function of a mind which is a universal. It is this definition, the function of the mind, which is my topic.

Every life support system of a living organism performs a function which is aimed at, by definition, survival. One can say that survival is the recursion of life over time. Each life support system of the body is thus tasked to acquire from the environment the materials required by that organism to literally construct the physical products required for its recursion, its life. These products are thus designated as personal property.

Each of the other life support systems of our body targets various physical aspects of the environment which helps the body whole achieve the same directive, life. The mind, targets the unity of the whole, or again, environmental management for the other life support systems. One can say that its job is integration. Integration is based on the recognition of time itself, managing the entire organism, through time within the environment by remembering the past in order to make a future. This is called judgment which is called the recognition of good

and evil, moral and ethical behavior, Law and virtue, etc.; being synonyms for the biologically defined job of a mind as its function to effect life supporting behavior.

Memory is thus the key stuff which a mind processes. A mind is a symbolic information processor which acquires its data from memory. Perceptions are stored in memory, and conception is the mental processing of memory in order to afford a species recursive life supporting behavior over its own body and over the environment which must maintain that very same body.

The fundamental physical fact which allows the construction of a mind is the intelligible definition of a thing which is a binary construct. A thing is composed from limits and material differences within those limits. One can go off half cocked and call this recognition of a Quantum Reality, providing one is so simple as to imagine that reality somehow differs from itself which makes any adjective superfluous. This is a universal physical fact. Every thing is an intelligible binary and this intelligible binary provides the method by which a mind recursively uses memory to the advantage of that form of life.

The intelligible binary means that evolution, throughout the universe, will lead to mind simply because it affords a species the most powerful life support system possible, predictive behavior; the ability to predict the behavior of any thing and every thing using the recursion of memory acquired by perception. Thus while the ability to perceive the environment for any species varies, the results in evolution to recursively apply those memories for survival is a constant: This fact leads to Universal Sapient Law and a factual method by which intelligence can be measured against a single standard.

Memory management systems are each aimed at the binary recursion of memory in order to predict life supporting behavior of that form of life. By binary recursion of the intelligible of binary with the binary of

memory, stored perceptions, affords a species exactly four methods of what is called Grammar Systems; i.e. a functional mind evolves the recognition of, and the utilization of, a Grammar matrix which is the product of the intelligible binary as multiplied by a form of life's physical abilities to produce exactly four binary results in behavior which is aimed at memory over time and distributed among the population of that form of life. For mankind these are called Common Grammar, Arithmetic, Algebra and Geometry. Grammar systems are thus the universal behaviors which are recognized by a species and guide the behavior of that species regardless of the diversity of each members particular perceptions which is available to it.

An intelligence quotient is then the ratio between the universal definition of a mind, established by binary fact, to a minds ability to grammatically manage memory. Psychology is then commensurate with the Principles of Language which are functionally resident in a mind as grammar systems which are aimed at survival. This is the fitness of any mind: A mind is designed to say what it sees in such a manner as to effect human response aimed at the management of the environment of the mind starting with its own body progressing unto the environment as a whole in order to maintain and promote life, the simple biological imperative of a life support system.

Summing the preceding up; it is a fact that among mankind today it recognizes no standard of mental or social behavior. It does not even recognize the grammar matrix. Its intelligence thus falls far short of a sapient form of life. It is stupid, schizophrenic, dangerous and self-destructive which are all due to its stage of evolutionary progress. And as a biological imperative it is up to the best members of that sad state of affairs to do what a life support system is designed to do, get a grip on the situation and produce the environmental artifacts which are required

to promote the evolution of intelligence. Mankind is currently exposing its lack of functional behavior by its use of symbols which do not comply with the factual standard of grammar systems as defined by the simple unit also known as a thing. It is in a stage of simply sticking symbols together to make words and words into chains of words which are often just pure gibberish while imagining that it is producing not factual gibberish, but sense. As it does not recognize a thing as a binary, it is not even aware that there are only two possible parts of grammar, nouns and verbs, absolutes and relatives, nor does it know how to pair them in reference as an operand and as an operator which means, it has not mastered the intelligible of simple arithmetic which makes geometric, metaphorical, reasoning almost impossible. Therefore, it is the discovery of, and the deployment of, factual guides to correct mental behavior using these grammar systems as environmental artifacts which may be utilized by the more intelligent and curious of the species. In that regard, my personal contribution is called *The Art of Prophecy*.

Language is Universal and Intelligible. Grammar is Particular and Perceptible. The multiplication of these two, produces exactly four result, Common Grammar, Arithmetic, Algebra and Geometry. Language is a class of all things, while grammar differentiates that class between the living and the dead. The achievement of evolution is first the physical matrix which makes the physical recursion of the body possible, while the second stage of evolution achieves the intelligible matrix which makes possible a life form's awareness of purpose and able to achieve personal and environmental management in order to produce a perpetual recursion of that form of life: to have life and to have it more abundantly. Currently the greatest environmental challenge for the intelligent, is the avoidance of the so-called intelligentsia and literati, who are simply out of their minds, both of these social categories are made up of a majority of parrots and a few simply insane. Our educational systems today are

chiefly staffed with wholly unintelligent parrots happy to repeat any gibberish whatsoever.
